Electronic Flora - Montserrat

Electronic Flora - Montserrat is an album containing drawings and music performed by nine different plants recorded at Montserrat in Spain. The plants have been recorded using GSR sensors, the sensors reads electronic impulses within the plants and converts these impulses into MIDI-data. The MIDI data is then fed through a modular synthesizer to make music controlled by the plants. This work is also presented as an multichannel audio-visual installation with video and audio of each plant. The MIDI-data from the plants then also controls parts of the video editing. The work is presented on four rear projected screens with eight audio channels creating an immersive soundscape.

Installation view from Spriten Kunsthall, Norway.

Below are links to audio and video examples.
